Vario System: The Compatible System

The Vario System is a sophisticated profile system that offers a wide range of connection elements that can be used for thousands of applications. This unique system enables companies to enhance and expand their automated systems easily and cost effectively.

The combination of components offered by the Vario System provides companies with alternatives to building machine frames or other industrial applications. The construction of complex designs becomes simple with the Vario System's easy attachments.

Specially designed for mechanical engineering, the Vario System can help reduce design work and lower production costs by shortening assembly times, resulting in increased productivity for your company.

Unique compatibility

The Vario System stands out in the marketplace because of the unique advantage it offers to its customers. The system has been designed to be compatible with other brand name European standard systems. The various top quality profiles and accessories can be combined with many other systems, providing flexibility for you and your business.
No longer is it necessary to purchase an entirely new and costly system. With the Vario System, companies now have the option to expand or enhance their existing systems by adding newer components as needed.

Pre-engineered solutions

The reduction of the design work allows for shorter assembly times which enables the company to allocate more resources on production.

Variety

The Vario System offers a wide range of connection elements and an extensive range of aluminum profiles, a large selection of fasteners, hinges and mounting hardware. With access to such a large selection, companies are able to incorporate components into their existing machine frame easily, allowing for a wider variety for their automated systems.

Quality

The profiles are made of aluminum that are manufactured with an anodizing coating which provides an anti-corrosive finish. The aluminum material 6061 has a rigidity of 95 HB and is used for most profiles to ensure strength. Tolerances of 1.5 mm are allowed on a 6 m (0.059 inches on a 19.68 feet long) profile.
The end result is not only esthetically pleasing but top quality. The frames are also lightweight without compromising strength.
